JavaScript

INTERVIEW

QUESTIONS & ANSWERS

Q 1. What is JavaScript?

ANS: JavaScript is a lightweight, interpreted programming language used to create dynamic and interactive web pages.

Q 2. Is JavaScript synchronous or asynchronous?

ANS: JavaScript is single-threaded and synchronous, but it supports asynchronous behavior using callbacks, promises, and async/await.

Q 3. What are data types in JavaScript?

ANS: Primitive: string, number, boolean, undefined, null, symbol, bigint

Non-primitive: object, array, function

Q 4. Difference between var, let, and const?

ANS: var: function-scoped

let: block-scoped

const: block-scoped, cannot be reassigned

Q 5. What is hoisting?

ANS: Hoisting is JavaScript's behavior of moving declarations to the top of the scope before execution.

Q 6. What is closure?

ANS: A closure is a function that remembers variables from its outer scope even after the outer function has executed.

Q 7. What is this keyword?

ANS: **this** refers to the object that is currently calling the function.

Q 8. What is an arrow function?

ANS: Arrow functions are shorter syntax functions and do not have their own **this**.

Q 9. Difference between == and ===?

ANS: == checks value only, === checks value and type.

Q 10. What is a callback function?

ANS: A function passed as an argument to another function and executed later.

Q 11. What are promises?

ANS: Promises represent the result of an asynchronous operation: **pending**, **fulfilled**, or **rejected**.

Q 12. What is async/await?

ANS: It is syntax to handle promises in a cleaner, synchronous-looking way.

Q 13. What is event bubbling?

ANS: Event bubbling means the event propagates from child to parent.

Q 14. Difference between == and ===?

ANS: Event capturing propagates events from parent to child.

Q 15. What is the DOM?

ANS: DOM (Document Object Model) represents the HTML structure as objects.

Q 16. Difference between null and undefined?

ANS: **null** is intentional empty value, **undefined** means variable is declared but not assigned.

Q 17. What is NaN?

ANS: NaN stands for “Not a Number” and represents invalid number operations.

Q 18. What is the spread operator?

ANS: ... is used to expand arrays or objects.

Q 19. What is the rest operator?

ANS: It collects multiple values into a single array.

Q 20. What is destructuring?

ANS: Destructuring extracts values from arrays or objects into variables.

Q 21. What is an IIFE?

ANS: Immediately Invoked Function Expression runs as soon as it is defined.

Q 22. What are JavaScript arrays?

ANS: Arrays store multiple values in a single variable.

Q 23. Difference between map, filter, and reduce?

ANS: **map:** transforms array

filter: selects items

reduce: accumulates values

Q 24. What is a prototype?

ANS: Prototype allows objects to inherit properties and methods.

Q 25. What is prototype chaining?

ANS: Accessing properties through a chain of prototypes.

Q 26. What is memory leak?

ANS: Unused memory that is not released properly.

Q 27. What is setTimeout?

ANS: Executes code after a specified delay.

Q 28. What is setInterval?

ANS: Executes code repeatedly at given intervals.

Q 29. What is JSON?

ANS: JavaScript Object Notation is a data exchange format.

Q 30. Difference between call, apply, and bind?

ANS: **call:** arguments individually

apply: arguments as array

bind: returns new function

Q 31. What is currying?

ANS: Transforming a function with multiple arguments into nested functions.

Q 32. What is debouncing?

ANS: Limits function execution after a delay.

Q 33. What is throttling?

ANS: Limits function execution at fixed intervals.

Q 34. What is strict mode?

ANS: "use strict" enforces cleaner and safer JavaScript code.

Q 35. What is lexical scope?

ANS: Scope defined by code placement, not execution.

Q 36. What is an object?

ANS: A collection of key-value pairs.

Q 37. Difference between shallow and deep copy?

ANS: Shallow copy shares references, deep copy creates independent copies.

Q 38. What is localStorage?

ANS: Limits function execution after a delay.

Q 39. What is sessionStorage?

ANS: Stores data for the browser session only.

Q 40. What is event delegation?

ANS: Handling events using a parent element.

Q 41. What is a module?

ANS: A reusable piece of code exported and imported.

Q 42. What is typeof operator?

ANS: Used to check the data type of a variable.

Q 43. What is garbage collection?

ANS: Automatic memory management in JavaScript.

Q 44. What is temporal dead zone?

ANS: Accessing let or const before declaration causes error.

Q 45. What is optional chaining?

ANS: Safely access nested object properties using ?.

Q 46. What is a promise chain?

ANS: Multiple **.then()** calls linked together.

Q 47. What is the event loop?

ANS: Handles asynchronous operations in JavaScript.

Q 48. What are higher-order functions?

ANS: Functions that accept or return other functions.

Q 49. What is memoization?

ANS: Caching function results for performance.

Q 50. What is JavaScript engine?

ANS: Program that executes JavaScript code (e.g., V8).
